Basalt and rhyolite are by far the most common rocks you will find on Lake Superior's North Shore beaches. Basalt is one of the four rock-types that make up the basement bedrock of the earth's crust. Basically it is lava that cooled quickly on the surface. The faster lava cools the smaller the crystals are.

The Rock Picker's Guide to Lake Superior | Northern Wilds ...

Granite is formed deep underground and stays there for a time, cooling slowly. This process forms large crystals and includes minerals like quartz, feldspar and mica embedded within the rock. It is coarse grained and speckled. Although it appears quite different, it is similar in basic composition to rhyolite - rich in silica and poor in iron.
